

AI Solutions Website and AI Guide

Project charter and delivery plan

Version 1.0 | September 28, 2026 | Planning baseline

Prepared for the AI Solutions project owner and delivery team.

Purpose

We want a website that draws people into our ideas, helps them understand what we are building, and gives them a welcoming way to participate. A friendly intelligent agent will answer questions using an approved FAQ and material from our GitHub documentation, including our constitution, ideas, and operating system concepts.

This document preserves the direction of the project and provides a detailed to-do list. It is the starting reference for later design and implementation. The immediate deliverable is this documented plan; the delivery sequence and technical choices below remain proposals for subsequent work.

Requirements from the discussion

- Create an engaging website that makes visitors curious and invites them to become involved.
- Provide an intelligent conversational guide with a warm, friendly, smooth, charming, and welcoming manner.
- Ground answers in a strong FAQ and approved GitHub material about the constitution, ideas, and operating system vision.
- Open the guide from a glowing circular button at the bottom right that stays visible while the visitor scrolls.
- Explore purple with a sparkling gold electrical ring as the latest visual direction for the button.
- Invite visitors to follow the business. Include Facebook and Instagram; consider TikTok as an optional addition.
- Keep a durable written record and build on it so ideas survive transitions between conversations and contributors.

Boundaries of this version

AI Solutions and JARVIS remain the existing project references; final public naming can be confirmed during planning. No launch date, budget, provider, social handle, or publication commitment is established by this document. All 80 checklist items begin as open planning tasks, including verification of any work that already exists.

The website experience and glowing agent button

The visitor journey

A visitor arrives, understands the purpose of the project, and explores the ideas at their own pace. The glowing button provides an obvious way to ask a question from anywhere on the page. The guide explains the relevant idea, offers a useful next step, and can invite the visitor to follow an official social account when that fits the conversation.

Persistent circular launcher

The button stays in the bottom right of the visible browser window while the page scrolls. This records the scrolling behavior described in the discussion. It does not require the button to chase the pointer. Clicking or tapping it opens the conversation panel; closing the panel returns the visitor to the page.

Element	Design requirement
Shape	A clearly circular, prominent launcher with an easy click or tap target.
Position	Bottom right of the viewport with enough spacing from edges and other controls.
Appearance	Purple with sparkling gold around the ring; an electrical energy effect. Exact balance to be refined in a visual review.
Motion	Gentle glow and flowing sparks. A quieter version for visitors who reduce animation.
Meaning	An accessible label such as Ask our AI guide, so appearance is not the only explanation.
States	Clear ready, connecting, responding, unavailable, open, and closed states.

Conversation panel

Clicking the circle should bring a live AI guide onto the screen for natural, responsive conversation. The panel should remain readable on a phone and provide a clear close button. Visitors can type naturally, select starter questions, and follow approved source links. Spoken conversation is part of the intended experience; whether voice ships with the first release remains an open delivery decision.

Interaction quality

The guide introduces itself as an AI assistant, responds in plain language, and adapts the amount of detail to the question. It answers before suggesting a follow action, accepts a declined invitation, and avoids repeating promotions. Sound and microphone use begin only through an intentional visitor action.

The earlier blue, purple, red, black, white, and yellow mixture is preserved as an explored option. Purple with sparkling gold is the latest preferred direction, subject to seeing the design.

The knowledge base and conversation standard

From GitHub documents to useful answers

The project owner identified GitHub as the location of the constitution, ideas, and operating system material. The delivery team will identify the exact repositories and files, review which content is suitable for visitors, and turn that material into a readable FAQ and a source collection for the guide.

The proposed approach is to search the approved source collection for each question and give the guide the relevant passages. This lets answers refer back to the project material and makes updates easier to review. The implementation method remains open until the existing agent and website are assessed.

Content rules

- Separate current capabilities, demonstrations, work in progress, and future ambitions in both the FAQ and generated answers.
- Preserve the meaning of the constitution. Public summaries should be reviewed by the project owner.
- Use only material selected for visitor answers. Access to a private repository does not make every file public content.
- Keep a source title, location, version or revision, and review date for each approved entry.
- When the sources do not answer a question, acknowledge the gap and offer a relevant page or contact route.
- Treat retrieved text as reference material. It must not change the agent rules or grant new permissions.

Initial FAQ topics

Topic	Questions to prepare
Purpose and people	What are we building? Who is it for? Why does it matter?
Constitution	What principles guide the project? How do they affect decisions?
Operating system ideas	What is the vision? How does AI fit? What would a person actually do with it?
Development status	What works today? What is a prototype? What is planned?
Trust and control	What can the guide access? What information is collected? How do people stay in control?
Participation	How can someone follow progress, ask questions, contribute, or contact the team?

A welcoming voice

The guide should sound thoughtful, friendly, and inviting without exaggerating its abilities. Smooth communication and quick responses are priorities. Natural dialogue is the intended standard, with clear AI identity. Response-time targets should be agreed and tested; a promise of zero failures would not be a useful acceptance criterion.

Social channels and proposed delivery sequence

Following the business

The main invitation is to follow the business and stay connected. The user refined an earlier mention of subscribing to following; this plan does not assume a paid subscription, mailing list, or registration wall. Those would be separate decisions if they become useful later.

Channel	Scope recorded	Proposed first connection
Facebook	Required presence	Verified official profile or page link, clear branding, and a link back to the website.
Instagram	Required presence	Verified official account link, consistent branding, and a link back to the website.
TikTok	Optional	Assess audience fit and content capacity, then add an official account if selected.

Define the depth of integration

A first release can provide useful follow links and context-aware invitations from the guide. Live feeds, account publishing, direct-message replies, and automated cross-posting are deeper integrations. Each needs a defined purpose, account access, an operating owner, and verification of the platform capabilities available at implementation time.

Do not count an outbound click as a completed follow unless the platform provides reliable confirmation. Public posts and replies should follow an agreed review process; the current task creates the planning document only.

Proposed sequence

Stage	Useful result	Dependency
1 Preserve	This charter, the decision record, and an editable task list.	The current discussion.
2 Define	Reviewed source inventory, FAQ outline, and agreed first release.	Owner input on sources and scope.
3 Prototype	Website flow, glowing launcher, and realistic conversation examples.	Design direction and approved content.
4 Connect	Working guide grounded in approved material and real social links.	Agent runtime and account details.
5 Validate	Evidence that answers, mobile use, failure handling, and links work.	Integrated preview.
6 Release	A maintained public experience with clear ownership and monitoring.	Launch readiness and publication decision.

Delivery checklist 1 to 16

All items are open. Role names are proposed responsibilities, not confirmed assignments. Record an owner, status, target date, and evidence when work begins. Voice and TikTok tasks depend on their scope decisions.

Foundations

Proposed lead: Project owner with delivery lead. Begins when: The document is available.

Completion evidence: The first-release scope, responsibilities, and existing assets are recorded.

- 01 Define the audience** - Identify the main visitor groups and the questions each group is likely to bring.
- 02 Confirm public identity** - Confirm how AI Solutions, JARVIS, and any business names should appear together.
- 03 Inventory existing work** - Review the website demo, agent work, and reusable assets before planning replacements.
- 04 Choose the first release** - Decide the initial website pages, text and voice scope, and required social connections.
- 05 Name delivery owners** - Assign people to content, design, engineering, social channels, and ongoing operations.
- 06 Set spending boundaries** - Agree a development allowance and an operating-cost range after discovery.
- 07 Choose launch measures** - Select measures for useful conversations, source accuracy, site usability, and social engagement.
- 08 Maintain the project record** - Save this baseline in the shared project location and record later decisions with dates.

GitHub material and FAQ

Proposed lead: Content lead with project owner. Begins when: Exact source locations and access are confirmed.

Completion evidence: A reviewed public FAQ and an approved source inventory exist.

- 09 Locate authoritative sources** - Identify the repositories, branches, files, and document versions that describe the project.
- 10 Review publication scope** - Classify source material as suitable for visitors, suitable for a summary, or private.
- 11 Resolve content conflicts** - Identify outdated or contradictory statements and confirm which version takes precedence.
- 12 Draft the core FAQ** - Write answers covering purpose, constitution, operating system ideas, development status, and participation.
- 13 Create plain-language explanations** - Translate specialist concepts into examples that newcomers can understand.
- 14 Track sources for answers** - Record a source reference and review date for each FAQ answer and knowledge entry.
- 15 Review the public wording** - Have the project owner check accuracy, tone, public suitability, and future-capability labels.
- 16 Define the update process** - Specify how a GitHub change is reviewed, refreshed, tested, and released to the guide.

Delivery checklist 17 to 32

All items are open. Role names are proposed responsibilities, not confirmed assignments. Record an owner, status, target date, and evidence when work begins. Voice and TikTok tasks depend on their scope decisions.

Website and circular launcher

Proposed lead: Design lead with website engineer. Begins when: Audience, scope, and draft public content are available.

Completion evidence: A usable preview matches the visual and scrolling requirements.

17 Map the visitor journey - Connect the landing page, ideas, FAQ, AI conversation, and ways to follow.

18 Design the first screen - Explain the project clearly and make the invitation to explore immediately visible.

19 Design the gold and purple circle - Prepare a circular launcher with a purple presence and a sparkling electrical gold ring.

20 Keep the launcher visible - Anchor it at the bottom right of the viewport while the page scrolls.

21 Create clear button behavior - Define hover, focus, touch, open, close, connecting, and unavailable states.

22 Build the conversation panel - Provide readable messages, a question field, starter questions, and source links.

23 Adapt to smaller screens - Check the launcher and panel against phone edges, keyboards, navigation, and other notices.

24 Provide accessible interaction - Support keyboard use, visible focus, meaningful labels, sufficient contrast, and reduced motion.

Agent personality and conversation

Proposed lead: Conversation designer with content lead. Begins when: The reviewed FAQ and public positioning are available.

Completion evidence: Example conversations establish a consistent and useful manner.

25 Write the agent introduction - Explain briefly that visitors are talking to an AI guide for the project.

26 Define the speaking style - Use friendly, smooth, clear, charming, and inviting language without inflated promises.

27 Write starter conversations - Cover a curious newcomer, a detailed technical question, a skeptical visitor, and a potential follower.

28 Handle follow-up questions - Keep relevant conversation context and ask for clarification when the intended meaning is unclear.

29 Define honest uncertainty - Create useful responses for missing, conflicting, private, or outdated source information.

30 Make follow invitations natural - Offer a relevant official channel after helping, and respect a visitor who declines.

31 Provide a human contact route - Specify how unresolved questions or business enquiries can reach the right person.

32 Review tone with users - Read and try sample exchanges, then revise awkward, repetitive, or overpromotional language.

Delivery checklist 33 to 48

All items are open. Role names are proposed responsibilities, not confirmed assignments. Record an owner, status, target date, and evidence when work begins. Voice and TikTok tasks depend on their scope decisions.

Agent connection and source retrieval

Proposed lead: AI engineer with website engineer. Begins when: Approved material and a selected runtime approach are available.

Completion evidence: The preview answers through a working agent and traces factual claims to sources.

- 33 Assess the existing runtime** - Verify where the agent runs, what is functional, and what connection the website can use.
- 34 Choose the serving approach** - Compare the available runtime choices for answer quality, response speed, cost, and maintenance.
- 35 Prepare approved source entries** - Structure the reviewed material so relevant passages can be found for each question.
- 36 Connect the website to the agent** - Implement the request path, conversation lifecycle, and clear loading behavior.
- 37 Add grounded answer generation** - Give the agent relevant source passages and link factual answers to visitor-safe references.
- 38 Protect runtime credentials** - Keep secrets on the server and give integrations only the access required for their job.
- 39 Handle service limits and failures** - Manage timeouts, retries, usage limits, and offline states without pretending an answer succeeded.
- 40 Verify conversation separation** - Ensure one visitor cannot receive another visitor conversation or private project material.

Voice and smooth interaction

Proposed lead: AI engineer with experience designer. Begins when: The first-release voice decision is made and the text flow is stable.

Completion evidence: If selected, spoken conversation works with a reliable text alternative.

- 41 Confirm the voice milestone** - Decide whether spoken conversation is required for launch or a later release.
- 42 Select a suitable voice** - Compare clarity, warmth, pace, and pronunciation with the intended audience.
- 43 Make microphone activation explicit** - Provide an understandable start control and indicate when listening is active.
- 44 Support natural turn taking** - Test pauses, interrupted speech, corrections, and the ability to stop a spoken answer.
- 45 Keep the text alternative available** - Let visitors type or read when audio is inconvenient or unavailable.
- 46 Show voice state clearly** - Distinguish listening, thinking, speaking, muted, and disconnected states.
- 47 Test real listening conditions** - Try ordinary phone microphones, background noise, varied accents, and slower connections.
- 48 Measure perceived smoothness** - Set and test response-time targets; check awkward pauses, pronunciation, and recovery from dropped audio.

Delivery checklist 49 to 64

All items are open. Role names are proposed responsibilities, not confirmed assignments. Record an owner, status, target date, and evidence when work begins. Voice and TikTok tasks depend on their scope decisions.

Facebook Instagram and optional TikTok

Proposed lead: Social lead with project owner. Begins when: Account ownership, public naming, and integration depth are confirmed.

Completion evidence: Selected official profiles are connected and maintained.

49 Inventory official accounts - Confirm which Facebook and Instagram accounts already exist and who controls them.

50 Prepare any missing presence - Plan the appropriate business presence, access arrangements, and account recovery details.

51 Align profile branding - Prepare consistent names, descriptions, images, and website references for each channel.

52 Add verified follow links - Connect the website and guide to the exact official Facebook and Instagram destinations.

53 Decide on TikTok - Assess audience fit, creator capacity, and a realistic content approach before adding it.

54 Specify deeper connections - Decide whether feeds, publishing, or message handling are needed beyond follow links.

55 Verify integration requirements - Check current official platform rules, account eligibility, and permissions for each selected feature.

56 Test account and link behavior - Verify destinations on desktop and mobile, and provide a fallback when an embed fails.

Content and community participation

Proposed lead: Content lead with social lead. Begins when: The approved messaging and selected channels are ready.

Completion evidence: Visitors have a clear reason and a practical way to stay involved.

57 Choose content themes - Plan updates about the constitution, ideas, useful scenarios, progress, and common questions.

58 Draft launch content - Prepare introductory copy, simple visual explanations, and short social-ready explanations.

59 Define a sustainable cadence - Choose a publishing rhythm that the actual team can maintain.

60 Clarify contribution routes - Explain any available ways to ask questions, provide feedback, or help the project.

61 Prepare respectful invitations - Write follow prompts for the website and guide that do not interrupt the useful experience.

62 Create a feedback path - Let visitors report an unclear or inaccurate answer without having to join a mailing list.

63 Set response responsibilities - Assign an owner and expected handling process for comments and incoming enquiries.

64 Review community learning - Turn repeated questions and feedback into improvements to the FAQ and future content.

Delivery checklist 65 to 80

All items are open. Role names are proposed responsibilities, not confirmed assignments. Record an owner, status, target date, and evidence when work begins. Voice and TikTok tasks depend on their scope decisions.

Quality and launch readiness

Proposed lead: Quality lead with content owner. Begins when: An integrated preview is available.

Completion evidence: The launch checks on page 10 are supported by recorded evidence.

- 65 Build a realistic question set** - Cover FAQ topics, follow-ups, vague questions, missing facts, and future-versus-current claims.
- 66 Check answer accuracy** - Compare generated answers and citations against the approved sources.
- 67 Test misleading source content** - Verify that instructions embedded in retrieved material cannot change agent behavior or permissions.
- 68 Check the complete user flow** - Test page navigation, launcher, panel, close behavior, links, and contact or feedback paths.
- 69 Review devices and accessibility** - Check phones, desktop browsers, keyboard access, readable contrast, and reduced animation.
- 70 Test privacy and reliability** - Check session separation, unavailable services, retry behavior, and the agreed data handling.
- 71 Run a small user pilot** - Observe whether first-time visitors understand the project and find the guide useful.
- 72 Resolve release blockers** - Record serious failures, retest fixes, and present the working result for the launch decision.

Operations and continuous improvement

Proposed lead: Operations lead with project owner. Begins when: An operating plan and launch decision are available.

Completion evidence: The site can be maintained, monitored, and recovered after release.

- 73 Choose hosting and domain arrangements** - Confirm the production location, domain ownership, secure connection, and operational access.
- 74 Document data handling** - Decide what conversations or feedback are stored, for how long, and who can access or delete them.
- 75 Set usage and cost visibility** - Track service usage, response failures, and operating costs against the agreed budget.
- 76 Prepare recovery procedures** - Provide backups, a rollback route, and a way to disable the guide if it fails.
- 77 Assign maintenance responsibilities** - Name owners for content refreshes, account access, broken links, and service interruptions.
- 78 Release the agreed version** - Publish the reviewed experience and selected social changes after the owner launch decision.
- 79 Review performance regularly** - Compare useful answers, visitor feedback, response speed, and social engagement with the chosen measures.
- 80 Keep the roadmap current** - Update this document and decision record as evidence changes priorities and later ideas are selected.

Acceptance criteria and measures

These checks define the proposed evidence for a first public release. The delivery team should agree numerical targets during discovery rather than imply a service commitment before the runtime is assessed.

Area	Evidence required
Project clarity	A first-time visitor can explain the purpose and distinguish current work from future plans.
Circular launcher	The circle remains visible at the bottom right during scrolling and opens and closes the guide on phone and desktop.
Visual direction	The owner has reviewed the purple and sparkling gold design, including its quieter motion setting.
Knowledge quality	Reviewed test answers are supported by approved sources; gaps and conflicting information are handled honestly.
Conversation	The guide is friendly and useful, answers follow-ups, and avoids repetitive or pressuring invitations.
Live connection	A real end-to-end conversation works through the chosen runtime, and failures are visible and recoverable.
Social channels	Official Facebook and Instagram links resolve correctly. TikTok appears only if selected and ready.
Voice if selected	Listening, speaking, stopping, interruption, and the text alternative work in realistic conditions.
Privacy and control	Data handling is explained, conversations remain separate, and secrets or private documents are not exposed.
Operational handoff	Owners, update procedures, spending visibility, and a recovery route are documented.

Measures to collect

Review answer usefulness, factual accuracy, source coverage, unresolved-question rate, response delay, failed requests, and cost per useful conversation. Track launcher opens and outbound social clicks where appropriate. Review platform follower totals separately; a link click alone does not prove that someone followed.

Release decision

The project owner reviews the integrated experience and outstanding issues. Delivery should distinguish finished features from deferred ideas and name the person responsible for support. Any serious source-accuracy, privacy, or basic usability failure should be resolved before public release.

Decision record and continuity

Direction preserved from the discussion

Record	Current direction
D01	Create the formal project document first, then build on it.
D02	Make the website engaging and invite people to participate.
D03	Use an intelligent, friendly, smooth, charming AI guide.
D04	Ground the guide in a strong FAQ and approved GitHub constitution, ideas, and operating system material.
D05	Prioritize following the business. Facebook and Instagram are in scope; TikTok is optional.
D06	Use a glowing circular launcher at the bottom right that stays visible while scrolling.
D07	Use purple with sparkling gold electrical energy as the latest visual direction for review.
D08	Save the document and maintain context so ideas survive handoffs.

Open decisions for the next planning session

- Confirm the final public business and agent names, intended audience, and exact GitHub sources.
- Select which material can be public and who approves the FAQ and its updates.
- Choose whether smooth spoken conversation is required at launch or follows text chat.
- Confirm the agent runtime, hosting, available resources, target date, and operating budget.
- Identify official social accounts and decide whether integration means follow links, feeds, publishing, or message handling.
- Review a visual example of the purple and sparkling gold circle and decide whether TikTok belongs in the first release.

How this record stays useful

The editable master is the maintained planning record; the PDF is the readable snapshot of the same version. The companion project context record preserves the decisions, unresolved questions, and current next step. Later changes should update the master, the decision record, and the PDF version together.

A handoff should include these saved files and the latest completed and open tasks. File persistence preserves the record, but a new conversation or contributor still needs access to it. The next step is to review this baseline and resolve the initial source, scope, and visual decisions before further implementation.

Change history: Version 1.0 records the project direction, glowing launcher, live conversation and speed requirement, social scope, and 80-item checklist. The owner also requested check-in and merge of work already built; this is separate from completing the future roadmap.
